Blaser Swissslube Launches New Fluid for Magnesium Machining

GOSHEN, N.Y. - Blaser Swissslube, Inc., premier supplier of world class, Swiss-quality metalworking fluids, has launched Blasocut® for Magnesium Machining, the liquid tool that will allow improved part machining with less waste.

BC37MG is the ideal answer to instability, separations and short fluid life normally associated with machining magnesium, all while maintaining the expected advantages of Blasocut® including superior performance and dependability. A mineral oil-based, chlorine-free liquid tool, BC37MG is especially designed for magnesium machining with superb cutting performance and emulsion stability.

Especially suited for machining magnesium without separation, BC37MG is also suitable for other ferrous and non-ferrous materials such as brass and/or bronze, as it will not form insoluble lead soaps.

Founded in 1936, Blaser Swissslube, Inc. has formulated first-rate metalworking solutions for 70 years. Blaser metalworking fluids are recognized world wide for dependability in improving productivity tool life, production and part quality and reducing overall production costs. Blaser products are developed by a team of researchers at the Blaser headquarters in Switzerland, and U.S. production is based in Goshen, N.Y.
